

CLAIMS

We Claim

1. A data management architecture comprising:
 - a) an XOR engine;
 - b) a host network interface coupled to said XOR engine and for coupling to a host computer system;
 - c) a cache coupled to said XOR engine;
 - d) a storage device interface coupled to said cache and for coupling to a plurality of storage devices.
2. The data management architecture defined by Claim 1 wherein said XOR engine comprises:
 - a) a first transceiver coupled to said host network interface;
 - b) logic means for i) generating an XOR parity byte using said data and appending said parity byte to said data, ii) checking XOR parity, and iii) correcting detected parity errors;
 - c) a second transceiver coupled to said cache .
3. The data management architecture defined by Claim 1 wherein said host network interface comprises:
 - a) a physical interface;
 - b) a protocol engine coupled to the physical interface;
 - c) a receive buffer coupled to the protocol engine;
 - d) a transmit buffer coupled to the protocol engine;
 - e) interface buffers coupled to the transmit and receive buffers;
 - f) a bus coupled to the protocol engine;
 - g) a microcontroller coupled to the bus;
 - h) a memory coupled to the bus.

4. The data management architecture defined by Claim 1 wherein said cache comprises:

a plurality of cache segments, each of said cache segments including i) a dual port memory array, ii) a bus expander coupled between said XOR engine and said dual port memory array, iii) a bus funnel coupled between said XOR engine and said dual port memory array, and iv) a buffer coupled between said storage device interface and said dual port memory.

5. The data management architecture defined by Claim 1 wherein said storage device interface comprises:

- a) a physical interface;
- b) a protocol engine coupled to the physical interface;
- c) a receive buffer coupled to the protocol engine;
- d) a transmit buffer coupled to the protocol engine;
- e) interface buffers coupled to the transmit and receive buffers;
- f) a bus coupled to the protocol engine;
- g) a microcontroller coupled to the bus;
- h) a memory coupled to the bus.

6. A data management architecture comprising:

- a) an XOR engine;
- b) a host network interface coupled to said XOR engine and for coupling to a host computer system;
- c) a cache coupled to said XOR engine;
- d) a storage device interface coupled to said cache and for coupling to a plurality of storage devices,

wherein said XOR engine includes:

a first transceiver coupled to said host network interface;

logic means for i) generating an XOR parity byte using said data and appending said parity byte to said data, ii) checking XOR parity, and iii) correcting detected parity errors;

a second transceiver coupled to said cache .

7. A data management architecture comprising:

- a) an XOR engine;
- b) a host network interface coupled to said XOR engine and for coupling to a host computer system;
- c) a cache coupled to said XOR engine, said cache including a plurality of cache segments, each of said cache segments including i) a dual port memory array, ii) a bus expander coupled between said XOR engine and said dual port memory array, iii) a bus funnel coupled between said XOR engine and said dual port memory array, and iv) a buffer coupled between said storage device interface and said dual port memory;
- d) a storage device interface coupled to said cache and for coupling to a plurality of storage devices,
 - wherein said XOR engine includes:
 - a first transceiver coupled to said host network interface;
 - logic means for i) generating an XOR parity byte using said data and appending said parity byte to said data, ii) checking XOR parity, and iii) correcting detected parity errors;
 - a second transceiver coupled to said cache .
